

FOR PASTOR CRIS

# Live Translation for Our Services

While you preach in English, every visitor can hear your words in their own language — live, through their own phone and earbuds. Nothing to install, nothing to hand out: they scan a poster on the wall and tap their language.

## The journey of your voice

The whole journey is automatic — the operator only starts it before the service.

## What Sunday looks like

- 1 Before the service** — our operator connects the lapel mic and starts the system, silenced. A printed poster with a QR code is on the wall.
- 2 People arrive** — anyone who wants translation scans the poster with their phone camera, taps their language, and puts in their earbuds. That's all they ever do.

- 3 **Worship & announcements** — the system stays silenced; nothing plays in the earbuds.
  - 4 **You preach** — the operator taps one button, and your message flows to every listener in their own language, about 3 seconds behind your voice, with written captions on screen.
  - 5 **After the service** — the operator ends the session with one tap.
- 

## Languages ready today

BR Português

ES Español

FR Français

CN 中文

IN हिन्दी

SA العربية

Each listener picks their own — different people can listen in different languages at the same time.

---

## Where it all lives

### Our own server

The system runs on a private server we operate in a professional data center — managed by JC Business Solutions, protected behind encryption and passwords.

### AI translation engine

The translating is done automatically by a state-of-the-art AI language model (LLM) that listens to speech and speaks the translation live — no human interpreter involved.

### Nobody installs anything

Listeners just open a web page. No app, no account, no personal information collected.

---

## What the church needs to provide

**Nothing, really.** Each phone uses its own mobile data (about 20 MB per hour — less than a few minutes of video). The church's Wi-Fi is optional — helpful only for visitors who have no data plan.

Usage is measured per minute and per language, and a simple report is available after each service.
